

Abstract

This invention relates to the method of manufacturing of the laminate for packaging containing an aluminum foil. The purpose is offer of the manufacturing process of the good laminate for packaging without delamination.

For the purpose achievement, improvement in the adhesion intensity between the composition layers of the laminate is aimed at by coating of the adhesive resin to the innermost film surface of polyolefin, the lamination of the aluminum foil in the adhesives for dry laminations, reel shape rolling up of the web shape laminate, aging, un-winding from the reel, corona-discharge processing of the aluminum-foil surface, and the laminating of the fibrous carrier layer by the extrusion lamination of the molten polyolefin.
